SUMMARY

- Software Engineer with 3+ years building scalable, high-availability systems in production fintech environments; strong command of Java, Spring Boot, REST microservices, and AWS infrastructure with consistent, measurable delivery impact.
- Proven ability to own features end-to-end — from system design and API contracts through implementation, testing, CI/CD deployment, and production observability — across large, cross-functional engineering teams.
- Experienced with component-level system design, data modeling, and performance optimization in distributed environments; adept at writing clean, testable, maintainable code with a strong focus on reliability and scalability.

TECHNICAL SKILLS

Languages	Java (primary), Python, JavaScript, TypeScript, C++
Backend	Spring Boot, Spring MVC, Spring Data JPA, Microservices, REST APIs, Apache Kafka, Node.js
Frontend	React.js, Lit Web Components, TypeScript, HTML5, CSS3, ES6+
Databases	MySQL, MongoDB — schema design, query optimization, indexing, data pipelines
Cloud & Infra	AWS (EC2, S3, Lambda, RDS, VPC, IAM), Kubernetes, EKS, ECS, Docker, CI/CD, CodePipeline
Systems	Distributed Systems, Microservices Architecture, System Design, OOP, Data Structures & Algorithms
Tools & Process	Git, GitHub, JIRA, Postman, VSCode, Agile/Scrum, Code Review, Technical Documentation

EXPERIENCE

Software Engineer | Temenos USA Inc. | Orlando, FL *July 2025 – Present*

Temenos Transact Explorer — Core Banking Platform

- Designed and shipped a suite of configurable, production-grade UX components for a large-scale core banking platform serving millions of banking transactions; architected Lit Web Component modules integrated with Java Spring Boot service APIs, improving cross-team feature delivery velocity by 30%.
- Engineered end-to-end service action workflows in Java Spring Boot — defining strict REST API contracts, owning request/response schema validation, and implementing comprehensive error handling across 10+ high-traffic banking customer journeys including account management, fund transfers, and customer onboarding.
- Built a metadata-driven UI rendering engine that consumed backend JSON configuration to dynamically control field visibility, multi-step navigation, and form composition — eliminating hard-coded UI logic, reducing engineering change cycles, and enabling faster product iteration without front-end code changes.
- Developed a shared component library — paginated tables, filter panels, dialogs, multi-step forms — adopted across multiple product lines; reduced cross-team code duplication significantly and established consistent UI delivery standards across the engineering org.
- Debugged and resolved systemic Java backend API instability by instrumenting request payload tracing and response mapping analysis; reduced sprint defect cycle time by 30% and improved production system reliability measurably across all monitored customer journeys.
- Participated in API design reviews, sprint planning, and cross-functional technical discussions with product, design, and platform teams; maintained 100% on-time sprint delivery while upholding accessibility (WCAG) and code quality standards through rigorous peer code review.

Conversational Banking Platform — Service Layer

- Built Java Spring Boot backend microservices powering a conversational banking application — designed low-latency REST APIs serving real-time account data, transaction records, and customer profiles to a high-availability chat interface handling concurrent user sessions.
- Owned the full backend integration layer between the application and core banking systems: defined data contracts, handled authentication flows, managed error recovery, and optimized data retrieval paths to achieve consistent sub-second API response times.
- Collaborated with front-end and platform engineers on system design, integration testing, and production deployment; contributed to performance profiling and load-testing efforts that validated system behavior under peak concurrent traffic.
- Authored detailed API documentation and integration specs; led engineering onboarding sessions for new team members on service architecture, coding standards, and deployment workflows.

Software Engineer | Mphasis Limited – First Republic Bank | Bangalore, India *September 2021 – July 2023*

Enterprise Risk & Data Platform — Java Backend

- Engineered high-throughput Java Spring Boot backend services for a large-scale enterprise risk data platform processing millions of daily financial transactions — owned core business logic for multi-dimensional anomaly detection, behavioral pattern analysis, and configurable multi-tier alert triggering across thousands of customer account portfolios.
- Designed normalized MySQL database schemas and wrote heavily optimized SQL queries to support high-volume transactional data ingestion pipelines; applied indexing strategies, query execution plan analysis, and batching techniques that measurably improved data throughput and reduced report generation latency across analytical dashboards.
- Built and extended a rules-based workflow engine in Java to support fully configurable investigation lifecycle management — including dynamic case routing logic, state machine transitions, SLA-driven escalation paths, and assignment queue management — enabling the operations team to handle significantly higher case volumes without increasing headcount.
- Developed custom Java risk scoring modules that consumed real-time transactional and behavioral data feeds; implemented scoring pipelines with weighted feature evaluation and threshold-based classification, translating complex business requirements into deterministic, testable backend logic.
- Integrated Risk and Compliance Technology (RCT) components for enterprise-wide risk aggregation across all business lines, providing a unified real-time view of institutional risk exposure; designed data aggregation queries and caching strategies to keep dashboard load times within SLA under high concurrent usage.
- Designed and executed comprehensive end-to-end test strategies covering data pipeline correctness, rule engine accuracy, alert generation integrity, and report output validation — built reusable test fixtures and automated regression suites that reduced manual QA effort and caught regressions before production.
- Delivered measurable process improvements recognized by project leadership — reduced manual operational workload significantly and cut average alert-to-resolution turnaround time, directly improving team throughput across a 50+ person engineering and operations program.

EDUCATION

Master of Science in Computer Science *August 2023 – May 2025*

Florida Institute of Technology | Melbourne, Florida *GPA: 3.60 / 4.00*

- Outstanding Student of the Year 2025 — Department of Computer Science, Florida Institute of Technology

PROJECTS

Recipe Finder *React.js, Node.js, Express, MongoDB, AWS EC2*

- Designed and built a full-stack MERN web application — REST API backend with Express and Node.js, MongoDB data layer with Mongoose ODM, JWT-based stateless authentication, and a React.js front end — deployed on AWS EC2 with environment-based configuration for scalability.
- Implemented server-side input validation, API rate limiting, and secure session token lifecycle management; structured codebase with separation of concerns for maintainability and extensibility.

Handwritten Digit Recognition *Python, TensorFlow, Keras, NumPy, OpenCV*

- Designed and trained a CNN image classification model on the MNIST dataset (60,000 training samples); applied batch normalization, dropout regularization, and data augmentation to improve generalization accuracy on unseen inputs.
- Optimized model inference pipeline and integrated it into a real-time desktop GUI built with Tkinter; end-to-end latency from user input to classification result was under 100ms on standard hardware.

DigiFarmer *Flutter, Dart, TensorFlow Lite, LightGBM*

- Architected a cross-platform mobile application (Android & iOS) in Flutter with a TensorFlow Lite on-device inference engine for real-time image-based crop disease classification — designed for low-latency offline operation in low-connectivity rural environments.
- Integrated LightGBM tabular model for market price prediction and REST-based weather API for contextual recommendations; structured data flows using repository pattern for clean separation between data sources and UI.
